

Abstract

A method of using a wireless scheduling device to determine schedule availability for a set of attendees includes communicating an availability request to a server using the wireless scheduling device. The server has access to calendar data for each attendee on the set of attendees. In response to the availability request, a search is conducted of the calendar data of each attendee to produce an availability data set. The availability data set is transmitted to the wireless scheduling device. The availability data set may then be displayed on the wireless scheduling device.
